JEE Main/Boards

Example 1: In any triangle PQR, prove that, $(b+c)\cos P + (c+a)\cos Q + (a+b)\cos R = a+b+c$.

Sol: Simply, by using projection rule, we can solve the above problem.

$$\begin{aligned} \text{given L.H.S. } & (b+c)\cos P + (c+a)\cos Q + (a+b)\cos R \\ &= b\cos P + c\cos P + c\cos Q + a\cos Q + a\cos R + b\cos R \\ &= (b\cos P + a\cos Q) + (c\cos P + a\cos R) + (c\cos Q + b\cos R) \\ &= c + b + a = \text{R.H.S. [By using projection Rule]} \end{aligned}$$

Example 2: In any $\triangle ABC$,

If $a = 2, b = \sqrt{3} + 1$ and $C = 60^\circ$, solve the triangle.

Sol: Here, by using $\tan \frac{B-A}{2} = \frac{b-a}{b+a} \cot \frac{C}{2}$,

we can obtain the value of $B - A$.

Two sides and the included angle is given.

$$\begin{aligned} \therefore \tan \frac{B-A}{2} &= \frac{b-a}{b+a} \cot \frac{C}{2} = \frac{\sqrt{3}+1-2}{\sqrt{3}+1+2} \cot 30^\circ = \frac{\sqrt{3}-1}{\sqrt{3}+3} \sqrt{3} \\ &= \frac{\sqrt{3}-1}{\sqrt{3}+1} = \frac{\tan 60^\circ - \tan 45^\circ}{1 + \tan 60^\circ \tan 45^\circ} \end{aligned}$$

$$\tan(60^\circ - 45^\circ) = \tan 15^\circ$$

$$\therefore \frac{B-A}{2} = 15^\circ \text{ or } B-A = 30^\circ \quad \dots(i)$$

We know, $A+B+C = 180^\circ$

$$\Rightarrow A+B = 120^\circ \quad \dots(ii)$$

Solving (i) and (ii), we get $B = 75^\circ$ & $A = 45^\circ$

To find side c , we use sine rule

$$\frac{a}{\sin A} = \frac{c}{\sin 60^\circ}; \text{ or } c = 2\sqrt{2} \frac{\sqrt{3}}{2} = \sqrt{6}$$

Thus $A = 45^\circ$, $B = 75^\circ$ and $c = \sqrt{6}$.

Example 3: If $A = 30^\circ$, $a = 100$, $c = 100\sqrt{2}$, solve the triangle

Sol: Here, simply by using sine rule, we can obtain the required values.

$$\frac{a}{\sin A} = \frac{c}{\sin C} \Rightarrow \sin C = \frac{1}{2} \therefore C = 135^\circ \text{ or } 45^\circ$$

$$C = 45^\circ \Rightarrow B = 105^\circ; b = \frac{c \sin B}{\sin C} = \frac{100}{\sqrt{2}} (\sqrt{3} + 1)$$

$$C = 135^\circ \Rightarrow B = 15^\circ; b = \frac{c \sin B}{\sin C} = \frac{100}{\sqrt{2}} (\sqrt{3} - 1)$$

Example 4: In a triangle ABC, if $a=3$, $b=4$ and $\sin A = \frac{3}{4}$, then find the value of $\angle B$.

Sol: By using sine rule, we can obtain $\angle B$.

$$\text{We have, } \frac{\sin A}{a} = \frac{\sin B}{b} \text{ or } \sin B = \frac{b}{a} \sin A$$

Since, $a=3$, $b=4$, $\sin A=3/4$,

$$\text{We get, } \sin B = \frac{4}{3} \times \frac{3}{4} = 1$$

$$\therefore \angle B = 90^\circ$$

Example 5: Find the smallest angle of the triangle whose sides are $6+\sqrt{12}$, $\sqrt{48}$, $\sqrt{24}$.

Sol: The smallest angles of a triangle are those angles whose opposite sides are small.

$$\text{Let } a = 6 + \sqrt{12}, b = \sqrt{48}, c = \sqrt{24}$$

Here, c is the smallest side.

$\angle C$ is the smallest angle of the triangle.

$$\text{Now } \cos C = \frac{a^2 + b^2 - c^2}{2ab}$$

$$= \frac{(48+24\sqrt{3})+48-24}{4(3+\sqrt{3}).4\sqrt{3}} = \frac{\sqrt{3}}{2}$$

$$\text{So, } \angle C = \pi/6$$

Example 6: In a $\triangle ABC$, $\tan A \tan B \tan C = 9$. For such triangles, if $\tan^2 A + \tan^2 B + \tan^2 C = \lambda$ then find the value of λ .

Sol: Here, by solving

$$(\tan A - \tan B)^2 + (\tan B - \tan C)^2 + (\tan C - \tan A)^2 > 0,$$

we can obtain the value of λ .

$$\Rightarrow 2 \left(\tan^2 A + \tan^2 B + \tan^2 C - \tan A \tan B - \tan B \tan C - \tan C \tan A \right) > 0$$

$$\Rightarrow 3(\tan^2 A + \tan^2 B + \tan^2 C) - (\tan A + \tan B + \tan C)^2 > 0$$

$$\Rightarrow 3\lambda - (\tan A \cdot \tan B \cdot \tan C)^2 > 0;$$

$$\Rightarrow 3\lambda - 81 > 0 \therefore \lambda > 27$$

Example 7: In a triangle, a , b and A are given and c_1 , c_2 are two values of the third side c . Find the sum of the areas of two triangles with sides a , b , c_1 and a , b , c_2 .

Sol: Here, as we know $\cos A = \frac{b^2 + c^2 - a^2}{2bc}$, therefore, by solving this equation we can obtain c_1 and c_2 .

$$\cos A = \frac{b^2 + c^2 - a^2}{2bc} \text{ or } c^2 - (2b\cos A)c + (b^2 - a^2) = 0$$

Which is a quadratic in c , whose roots are c_1 and c_2 ; $\therefore c_1 + c_2 = 2b\cos A$ and $c_1 c_2 = b^2 - a^2$

\therefore Sum of areas of two Δ 's with sides a , b , c_1 & a , b , c_2 ;

$$= \frac{1}{2}bc_1 \sin A + \frac{1}{2}bc_2 \sin A$$

$$= \frac{1}{2}b(c_1 + c_2) \sin A = \frac{1}{2}b \cdot 2b \cos A \cdot \sin A = \frac{1}{2}b^2 \sin 2A$$

Example 8: In any triangle ABC, if $\tan \theta = \frac{2\sqrt{ab}}{a-b} \sin \frac{C}{2}$

Prove that $c = (a-b)\sec \theta$

Sol: As given, $\tan \theta = \frac{2\sqrt{ab}}{a-b} \sin \frac{C}{2}$. Hence, by solving this

and using formula $\cos C = \frac{a^2 + b^2 - c^2}{2ab}$, we can solve the above problem.

$$\therefore \tan \theta = \frac{2\sqrt{ab}}{a-b} \sin \frac{C}{2}$$

$$\therefore (a-b)^2 \tan^2 \theta = 4ab \sin^2 \frac{C}{2}$$

$$\text{or } (a-b)^2 (\sec^2 \theta - 1) = 4ab \sin^2 \frac{C}{2}$$

$$\text{or } (a-b)^2 \sec^2 \theta = (a-b)^2 + 4ab \sin^2 \frac{C}{2}$$

$$\text{or } (a-b)^2 \sec^2 \theta = a^2 + b^2 - 2ab \left(1 - 2\sin^2 \frac{C}{2}\right)$$

$$\text{or } (a-b)^2 \sec^2 \theta = a^2 + b^2 - 2ab \cos C$$

$$\left[\because \cos C = \frac{a^2 + b^2 - c^2}{2ab} \right]$$

$$\text{or } (a-b)^2 \sec^2 \theta = c^2; \therefore c = (a-b)\sec \theta$$

Example 9: In any Δ , prove that,

$$\frac{1}{a} \cos^2 \frac{A}{2} + \frac{1}{b} \cos^2 \frac{B}{2} + \frac{1}{c} \cos^2 \frac{C}{2} = \frac{s^2}{abc}$$

Sol: Here, simply by using trigonometric ratios of half angle formula we can prove the above example.

$$\text{Given L.H.S.} = \frac{1}{a} \cos^2 \frac{A}{2} + \frac{1}{b} \cos^2 \frac{B}{2} + \frac{1}{c} \cos^2 \frac{C}{2}$$

$$= \frac{1}{a} \cdot \left(\frac{s(s-a)}{bc} \right) + \frac{1}{b} \cdot \left(\frac{s(s-b)}{ac} \right) + \frac{1}{c} \cdot \left(\frac{s(s-c)}{ab} \right)$$

$$= \frac{s}{abc} (s-a+s-b+s-c)$$

$$= \frac{s}{abc} \{3s - (a+b+c)\} = \frac{s}{abc} (3s - 2s)$$

$$= \frac{s^2}{abc} = \text{R.H.S}$$

Hence proved.

Example 10: In any ΔABC , prove that

$$a\cos A + b\cos B + c\cos C = \frac{8\Delta^2}{abc}$$

Sol: By using sine rule, we can obtain values of a , b and c and then by substituting these values in L.H.S. we can prove this.

$$\frac{a}{\sin A} = \frac{b}{\sin B} = \frac{c}{\sin C} = k \text{ (let)} [\text{by sine rule}]$$

Then, $a = k \sin A$, $b = k \sin B$ and $c = k \sin C$

Now, $a\cos A + b\cos B + c\cos C$

$$= k \sin A \cos A + k \sin B \cos B + k \sin C \cos C$$

$$= \frac{k}{2} [\sin 2A + \sin 2B + \sin 2C]$$

$$= \frac{k}{2} [4 \sin A \sin B \sin C] = 2k \sin A \sin B \sin C$$

$$= 2a \sin B \sin C = 2a \cdot \frac{2\Delta}{ac} \cdot \frac{2\Delta}{ab}$$

$$\therefore \Delta = \frac{1}{2}ab \sin C = \frac{1}{2}ac \sin B \therefore \sin B = \frac{2\Delta}{bc}, \sin C = \frac{2\Delta}{ab}$$

$$= \frac{8\Delta^2}{abc} = \text{R.H.S}$$

Example 11: In a ΔABC , $\angle C = 90^\circ$, $a = 3$, $b = 4$ and D is a point on AB so that $\angle BCD = 30^\circ$. Find the length of CD .

Sol: Here, by using Pythagoras theorem and sine rule, we can obtain the length of CD .

In $\triangle ABC$, $\angle C = 90^\circ$

$$\therefore AB^2 = 3^2 + 4^2 = 25$$

$$AB = \sqrt{3^2 + 4^2} = 5$$

and

$$\therefore \sin A = \frac{3}{5}, \sin B = \frac{4}{5}$$

in $\triangle ABC$, by sine rule

$$\frac{BD}{\sin 30^\circ} = \frac{CD}{\sin B}$$

$$\therefore BD = \frac{\sin 30^\circ}{\sin B} \cdot CD = \frac{1}{2} \times \frac{5}{4} CD = \frac{5}{8} CD$$

... (i)

And in $\triangle ACD$, by sine rule

$$\frac{AD}{\sin 60^\circ} = \frac{CD}{\sin A}$$

$$\Rightarrow AD = \frac{\sin 60^\circ}{\sin A} CD = \frac{\sqrt{3}}{2} \times \frac{5}{3} CD = \frac{5\sqrt{3}}{6} CD$$

... (ii)

$$\text{But } BD + AD = AB \therefore \frac{5}{8} CD + \frac{5\sqrt{3}}{6} CD = 5$$

$$\text{Or } \frac{15 + 20\sqrt{3}}{24} CD = 5$$

$$\text{Or } CD = \frac{24}{3 + 4\sqrt{3}} = \frac{24(4\sqrt{3} - 3)}{48 - 9}$$

$$\text{Hence } CD = \frac{24}{39}(4\sqrt{3} - 3) = \frac{8}{13}(4\sqrt{3} - 3)$$

JEE Advanced/Boards

Example 1: Prove that, $\cos \frac{B-C}{2} = (b+c) \sin \frac{A}{2}$.

Sol: By using sine rule i.e.

$\frac{b+c}{a} = \frac{\sin B + \sin C}{\sin A}$, we can prove the above example.

$\frac{b+c}{a} = \frac{\sin B + \sin C}{\sin A}$, [using sine Rule]

$$= \frac{2 \sin \frac{B+C}{2} \cos \frac{B-C}{2}}{2 \sin \frac{A}{2} \cos \frac{A}{2}} = \frac{2 \cos \frac{A}{2} \cos \frac{B-C}{2}}{2 \sin \frac{A}{2} \cos \frac{A}{2}} = \frac{\cos \frac{B-C}{2}}{\sin \frac{A}{2}}$$

$$\therefore (b+c) \sin \frac{A}{2} = \cos \frac{B-C}{2}.$$

Example 2: If a_1, a_2, a_3 are the altitudes of the triangle PQR,

prove that, $\frac{\cos P}{a_1} + \frac{\cos Q}{a_2} + \frac{\cos R}{a_3} = \frac{1}{R}$.

Sol: Here, simply by using sine rule i.e.

$(\cos P)a = 2R \sin P \cos P$ and so on, we can prove the above problem.

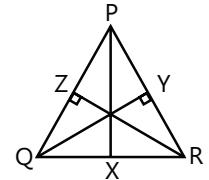

In $\triangle PQR$, consider, $PX = a_1, QY = a_2, RZ = a_3$.

Area of triangle PQR

$$= \Delta = \frac{1}{2} a a_1 = \frac{1}{2} b a_2 = \frac{1}{2} c a_3$$

$$a_1 = \frac{2\Delta}{a}, a_2 = \frac{2\Delta}{b}, a_3 = \frac{2\Delta}{c}$$

$$\begin{aligned} & \frac{\cos P}{a_1} + \frac{\cos Q}{a_2} + \frac{\cos R}{a_3} \\ &= \frac{(\cos P)a}{2\Delta} + \frac{(\cos Q)b}{2\Delta} + \frac{(\cos R)c}{2\Delta} \end{aligned}$$

$$= \frac{1}{2\Delta} [2R \sin P \cos P + 2R \sin Q \cos Q + 2R \sin R \cos R]$$

[using sine rule]

$$= \frac{R}{2\Delta} [\sin 2P + \sin 2Q + \sin 2R]$$

$$= \frac{R}{2\Delta} [2 \sin(P+Q) \cos(P-Q) + 2 \sin R \cos R]$$

$$= \frac{2R \sin R}{2\Delta} [\cos(P-Q) - \cos(P+Q)]$$

[using $P+Q+R=\pi$]

$$= \frac{R \sin R}{\Delta} 2 \sin P \sin Q = \frac{2R}{\Delta} \sin P \sin Q \sin R$$

$$= \frac{2R}{\Delta} \frac{a}{2R} \cdot \frac{b}{2R} \cdot \frac{c}{2R} \quad \text{[using sine rule]}$$

$$= \frac{abc}{4\Delta} \times \frac{1}{R^2} = \frac{R}{R^2} = \frac{1}{R} \quad \text{[by using } R = \frac{abc}{4\Delta}]$$

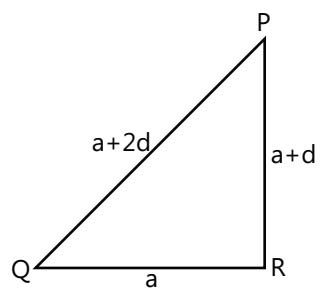

Example 3: If the sides of a triangle PQR are in A.P. and if its greatest angle exceeds the least angle by α ,

show that the sides are in the ratio $1-x : 1 : 1+x$

$$\text{where } x = \sqrt{\frac{1-\cos \alpha}{7-\cos \alpha}}$$

Sol: As the sides of a given triangle are in A.P., by considering the sides to be $a, a+d, a+2d$ and using sine rule, we can obtain the required result.

Consider the sides to be $a, a+d, a+2d : d > 0$

Let P be the least angle and R be the greatest angle.

Let $P = \phi$; then $R = \phi + \alpha$ and $Q = 180^\circ - (2\phi + \alpha)$

$$\begin{aligned} \frac{a}{\sin \phi} &= \frac{a+2d}{\sin(\phi+\alpha)} = \frac{a+d}{\sin(\pi-(2\phi+\alpha))} \\ \Rightarrow \frac{a}{\sin \phi} &= \frac{a+2d}{\sin(\phi+\alpha)} = \frac{a+d}{\sin(2\phi+\alpha)} = \frac{2(a+d)}{\sin \phi + \sin(\phi+\alpha)} \quad \dots(i) \end{aligned}$$

From the first and the second term,

$$\frac{a}{\sin \phi} = \frac{a+2d}{\sin(\phi+\alpha)} = \frac{a}{a+2d} = \frac{\sin \phi}{\sin(\phi+\alpha)}$$

By componendo and dividendo, we get,

$$\begin{aligned} \frac{a+a+2d}{a+2d-a} &= \frac{\sin \phi + \sin(\phi+\alpha)}{-\sin \phi + \sin(\phi+\alpha)} \\ \Rightarrow \frac{2(a+d)}{2d} &= \frac{2 \sin \left(\phi + \frac{\alpha}{2} \right) \cos \frac{\alpha}{2}}{2 \cos \left(\phi + \frac{\alpha}{2} \right) \sin \frac{\alpha}{2}} \Rightarrow \frac{a+d}{d} = \frac{\tan \left(\phi + \frac{\alpha}{2} \right)}{\tan \frac{\alpha}{2}} \\ \Rightarrow \frac{d}{a+d} &= \frac{\tan \frac{\alpha}{2}}{\tan \left(\phi + \frac{\alpha}{2} \right)} \quad \dots(ii) \end{aligned}$$

From the third and the fourth term of equation (i) we get

$$\begin{aligned} \frac{a+d}{\sin(2\phi+\alpha)} &= \frac{2(a+d)}{\sin \phi + \sin(\phi+\alpha)} \Rightarrow 2 = \frac{\sin \phi + \sin(\phi+\alpha)}{\sin(2\phi+\alpha)} \\ \Rightarrow 2 &= \frac{\cos \frac{\alpha}{2}}{\cos \left(\phi + \frac{\alpha}{2} \right)} \Rightarrow \cos \left(\phi + \frac{\alpha}{2} \right) = \frac{\cos \frac{\alpha}{2}}{2} \\ \therefore \tan \left(\phi + \frac{\alpha}{2} \right) &= \frac{\sqrt{4 - \cos^2 \frac{\alpha}{2}}}{\cos \frac{\alpha}{2}} \quad \dots(iii) \end{aligned}$$

From (ii) and (iii) we get,

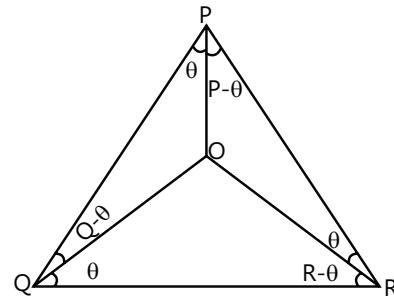

$$\begin{aligned} \frac{d}{a+d} &= \frac{\sin \frac{\alpha}{2}}{\sqrt{4 - \cos^2 \frac{\alpha}{2}}} = \sqrt{\frac{\sin^2 \frac{\alpha}{2}}{4 - \cos^2 \frac{\alpha}{2}}} \\ \Rightarrow \frac{d}{a+d} &= \sqrt{\frac{\frac{1 - \cos \alpha}{2}}{\frac{1 + \cos \alpha}{2}}} = \sqrt{\frac{1 - \cos \alpha}{7 - \cos \alpha}} = x \end{aligned}$$

Required ratio is $a : a+d : a+2d$

$$= 1 - \frac{d}{a+d} : 1 : 1 + \frac{d}{a+d} = 1 - x : 1 : 1+x$$

Example 4: Let O be a point inside a triangle PQR such that $\angle OPQ = \angle OQR = \angle ORP = \theta$. Show that $\cot \theta = \cot P + \cot Q + \cot R$.

Sol: Simply, by applying sine rule in $\triangle POQ$ and $\triangle QOR$, we can prove the above problem.

$$\angle POQ = \pi - Q \text{ and } \angle QOR = \pi - R$$

Applying the sine rule in $\triangle POQ$,

$$\text{we have } \frac{c}{\sin(\pi - Q)} = \frac{OQ}{\sin \theta} \Rightarrow OQ = \frac{c \sin \theta}{\sin Q} \quad \dots(i)$$

Applying the sine rule in $\triangle QOR$,

$$\text{we have } \frac{OQ}{\sin(R - \theta)} = \frac{a}{\sin(\pi - R)} \Rightarrow OQ = \frac{a \sin(R - \theta)}{\sin R} \quad \dots(ii)$$

$$\text{From (i) and (ii), we have } \frac{c \sin \theta}{\sin R} = \frac{a \sin(R - \theta)}{\sin R}$$

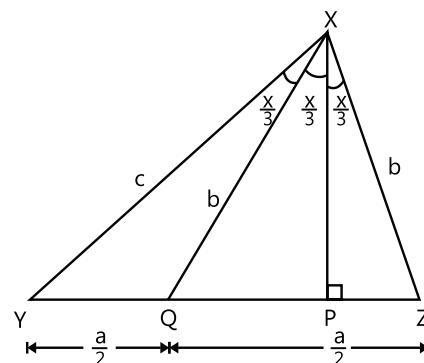

Using Sine Rule we have

$$\frac{2R \sin R \sin \theta}{\sin Q} = \frac{2R \sin P \sin(R - \theta)}{\sin R}$$

$$\frac{\sin R}{\sin P \sin Q} = \frac{\sin(R - \theta)}{\sin R \sin \theta}; \frac{\sin(P + Q)}{\sin P \sin Q} = \cot \theta - \cot R$$

$$\cot Q + \cot P = \cot \theta - \cot R \text{ or } \cot \theta = \cot P + \cot Q + \cot R.$$

Example 5: In a triangle XYZ, the median XQ and the perpendicular XP from the vertex X to the side QR divide angle X into three equal parts. Show that

$$\cos \frac{X}{3} \sin^2 \frac{X}{3} = \frac{3a^2}{32bc}.$$

Sol: By using the cosine rule in ΔXYQ and ΔPQR and then subtracting them, we'll get the result.

$$\text{As given, } \angle YXQ = \angle QXP = \angle PXZ = \frac{\alpha}{3}; YQ = ZQ = \frac{a}{2}$$

$$QP = PZ = \frac{a}{4} [\text{Since } \Delta XQP \text{ and } \Delta XPZ \text{ are congruent}]$$

$$XQ = XZ = b \quad \therefore \text{In } \Delta XYQ$$

$$\cos \frac{\alpha}{3} = \frac{c^2 + b^2 - \frac{a^2}{4}}{2bc} = \frac{4c^2 + 4b^2 - a^2}{8bc} \quad \dots(i)$$

$$\text{In } \Delta PQR, \text{ we have } \cos P = \frac{c^2 + b^2 - a^2}{2bc}$$

$$4\cos^3 \frac{\alpha}{3} - 3\cos \frac{\alpha}{3} = \frac{c^2 + b^2 - a^2}{2bc} \quad \dots(ii)$$

Subtracting (ii) from (i) we get

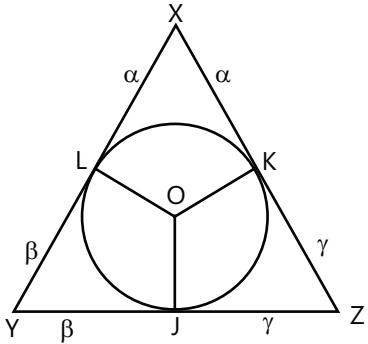

$$\begin{aligned} & \cos \frac{\alpha}{3} - 4\cos^3 \frac{\alpha}{3} + 3\cos \frac{\alpha}{3} \\ &= \frac{4c^2 + 4b^2 - a^2}{8bc} - \frac{c^2 + b^2 - a^2}{2bc} \end{aligned}$$

$$4\cos \frac{\alpha}{3} \left(1 - \cos^2 \frac{\alpha}{3}\right) = \frac{3a^2}{8bc};$$

$$\cos \frac{\alpha}{3} \sin^2 \frac{\alpha}{3} = \frac{3a^2}{32bc}.$$

Example 6: If α, β and γ are the distances of the vertices of a triangle XYZ from nearest points of contact of the incircle with sides of ΔXYZ ,

$$\text{prove that } r^2 = \frac{\alpha\beta\gamma}{\alpha + \beta + \gamma}.$$

Sol: Here, as we know, $\Delta = \sqrt{s(s-a)(s-b)(s-c)}$ and $r = \frac{\Delta}{s}$.

Given $XL = XK = \alpha, YL = YJ = \beta, ZJ = ZK = \gamma$

$$2s = XY + YZ + ZX = c + a + b = 2\alpha + 2\beta + 2\gamma$$

$$\text{Area of triangle } XYZ = \sqrt{s(s-a)(s-b)(s-c)}$$

$$= \sqrt{(\alpha + \beta + \gamma)\alpha\beta\gamma}$$

$$\therefore r = \frac{\Delta}{s} = \frac{\sqrt{(\alpha + \beta + \gamma)\alpha\beta\gamma}}{\alpha + \beta + \gamma}$$

$$\Rightarrow r^2 = \frac{\alpha\beta\gamma}{\alpha + \beta + \gamma}.$$

Example 7: In any triangle ABC, if

$$\cos \theta = \frac{a}{b+c}, \cos \phi = \frac{b}{a+c}, \cos \varphi = \frac{c}{a+b}$$

where θ, ϕ, φ lie between 0 and π ,

$$\text{prove that } \tan \frac{\theta}{2} \tan \frac{\phi}{2} \tan \frac{\varphi}{2} = \tan \frac{A}{2} \tan \frac{B}{2} \tan \frac{C}{2}.$$

Sol: Here, by using formula

$$\cos \theta = \frac{1 - \tan^2 \frac{\theta}{2}}{2} \text{ and } \frac{a}{b+c} = \cos \theta, \text{ we can}$$

solve the above problem.

$$\frac{a}{b+c} = \cos \theta = \frac{1 - \tan^2 \frac{\theta}{2}}{2}$$

By componendo and dividendo,

$$\frac{2}{2\tan^2 \frac{\theta}{2}} = \frac{a+b+c}{b+c-a}; \Rightarrow \tan^2 \frac{\theta}{2} = \frac{2s-2a}{2s} = \frac{s-a}{s}$$

$$\text{Similarly, } \tan^2 \frac{\phi}{2} = \frac{s-b}{s} \text{ and } \tan^2 \frac{\varphi}{2} = \frac{s-c}{s}$$

$$\therefore \tan^2 \frac{\theta}{2} \tan^2 \frac{\phi}{2} \tan^2 \frac{\varphi}{2} = \frac{(s-a)(s-b)(s-c)}{s^3} = \frac{\Delta^2}{s^4}$$

$$\therefore \tan \frac{\theta}{2} \tan \frac{\phi}{2} \tan \frac{\varphi}{2} = \frac{\Delta}{s^2} \quad \dots(i)$$

$$\text{Now } \tan \frac{A}{2} \tan \frac{B}{2} \tan \frac{C}{2}$$

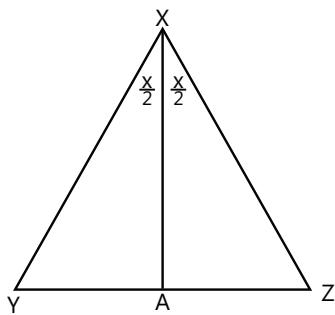

$$= \sqrt{\frac{(s-b)(s-c)(s-c)(s-a)(s-a)(s-b)}{s(s-a)s(s-b)s(s-c)}}$$

$$= \sqrt{\frac{(s-a)(s-b)(s-c)}{s^3}} = \frac{\Delta}{s^2} \quad \dots(ii)$$

From (i) and (ii)

$$\tan \frac{\theta}{2} \tan \frac{\phi}{2} \tan \frac{\varphi}{2} = \tan \frac{A}{2} \tan \frac{B}{2} \tan \frac{C}{2}.$$

Example 8: The bisector of angle X of triangle XYZ meets YZ at A. If $XA = \ell$ then, prove that

$$(i) \ell = \frac{2bc}{b+c} \cos \frac{x}{2} \quad (ii) \frac{a}{b+c} = \sqrt{1 - \frac{1}{bc}}$$

Sol: (i) Simply by using area of triangle formula, we can prove the above equation.

(ii) Here, by using cosine rule, we can prove it.

$$(i) \text{Area of } \triangle XYZ = \text{Area of } \triangle XYA + \text{Area of } \triangle XAZ$$

$$\frac{1}{2}bc \sin X = \frac{1}{2}c\ell \sin \frac{X}{2} + \frac{1}{2}b\ell \sin \frac{X}{2}$$

$$2bc \cos \frac{X}{2} = \ell(b+c); \Rightarrow \ell = \frac{2bc}{b+c} \cos \frac{X}{2}$$

$$(ii) \frac{YA}{AZ} = \frac{XY}{XZ} = \frac{c}{b} \text{ or } \frac{YA}{c} = \frac{ZA}{b} = \frac{YA+ZA}{c+b} = \frac{a}{c+b}$$

$$\Rightarrow \frac{YA}{c} = \frac{a}{c+b} \quad \dots (i)$$

$$\text{In triangle XYA, } \cos \frac{X}{2} = \frac{c^2 + \ell^2 - YA^2}{2c\ell}$$

$$\Rightarrow -2c\ell \cos \frac{X}{2} + c^2 + \ell^2 = YA^2$$

Substituting value of $\cos \frac{X}{2}$ from (i) we get

$$QA^2 = -2c\ell \frac{\ell(b+c)}{2bc} + c^2 + \ell^2 = \frac{c^2b - \ell^2c}{b}$$

$$\text{Equation (A) gives } \frac{(QA)^2}{c^2} = \left(\frac{a}{c+b} \right)^2$$

$$\text{or } \frac{c^2b - \ell^2c}{bc^2} = \left(\frac{a}{c+b} \right)^2 \text{ or } \sqrt{1 - \frac{\ell^2}{bc}} = \frac{a}{c+b}.$$

Example 9: A cyclic quadrilateral ABCD of area $\frac{3\sqrt{3}}{4}$

is inscribed in a unit circle. If one of its sides $AB=1$ and

$\angle A$ is acute and the diagonal $BD = \sqrt{3}$, find the lengths of the other sides.

Sol: Here, area of cyclic quadrilateral = area of triangle ABC + area of triangle BCD. Therefore by using cosine rule in triangle ABD and BCD, we will be solving the above example.

Given $AB=1$, $BD=\sqrt{3}$

$OA=OB=OD=OC=1=R$ (O being center of the circle),

in triangle ABD,

$$\frac{BD}{\sin A} = 2R \Rightarrow \frac{\sqrt{3}}{2} = \sin A \quad (\because \text{Given circle is circumcircle})$$

$$\text{of } \triangle ABD \Rightarrow A = \frac{\pi}{3}; \text{Hence } C = \frac{2\pi}{3}$$

$(\because ABCD \text{ is a cyclic quadrilateral})$

Using cosine rule in triangle ABD,

$$\cos A = \frac{(AB)^2 + (AD)^2 - (BD)^2}{2AB \cdot AD}$$

$$\frac{1}{2} = \frac{1 + (AD)^2 - 3}{2AD} \text{ or } AD^2 - AD - 2 = 0$$

$$\text{or } (AD - 2)(AD + 1) = 0; \therefore AD = 2$$

Using cosine rule in triangle BCD, we have

$$\cos C = \frac{(BC)^2 + (CD)^2 - (BD)^2}{2(BC) \cdot (CD)} \Rightarrow -\frac{1}{2} = \frac{(BC)^2 + (CD)^2 - 3}{2(BC) \cdot (CD)}$$

$$\text{or } (BC)^2 + (CD)^2 + (BC)(CD) - 3 = 0 \quad \dots (i)$$

Area of cyclic quadrilateral = Area of triangle ABC + Area of triangle BCD

$$\frac{3\sqrt{3}}{4} = \frac{1}{2} \cdot 1 \cdot 2 \sin \frac{\pi}{3} + \frac{1}{2} \cdot BC \cdot CD \sin \frac{2\pi}{3}$$

$$3 = 2 + BC \cdot CD \text{ or } BC \cdot CD = 1 \quad \dots (ii)$$

Solving (i) and (ii), we get $BC = CD = 1$

Hence length of sides of cyclic quadrilateral are

$$AD = 2, BC = CD = 1.$$

Example 10: The sides of a triangle are in A.P. and its area is $\frac{3}{5}$ th of an equilateral triangle of the same perimeter. Prove that the sides are in the ratio 3:5:7.

Sol: Here, sides of triangle are in A.P. Hence, by considering the sides to be $a-d$, a and $a+d$ and then by using area of triangle formula and the given conditions, we can prove the given ratios.

Let the sides be $a-d$, a and $a+d$.

$2s = \text{sum of the sides} = 3a$

$$\therefore s = \frac{3a}{2}$$

Now, $\Delta_1 = \text{Area of the triangle whose sides are in A.P.}$

$$\begin{aligned} &= \sqrt{\frac{3a}{2} \left[\frac{3a}{2} - a + d \right] \left[\frac{3a}{2} - a \right] \left[\frac{3a}{2} - a - d \right]} \\ &= \frac{\sqrt{3}a}{4} \sqrt{(a+2d)(a-2d)} \text{ or } \Delta_1 = \frac{\sqrt{3}a}{4} \sqrt{a^2 - 4d^2} \quad \dots (\text{i}) \end{aligned}$$

Perimeter of equilateral triangle = Perimeter of the given triangle

$$\therefore 3 \times \text{One side of equilateral triangle} = 3a$$

$$\Rightarrow \text{Side of the equilateral triangle} = a$$

Now, $\Delta_2 = \text{Area of the equilateral triangle}$

$$= \frac{\sqrt{3}}{4} \times (\text{side})^2 = \frac{\sqrt{3}}{4} a^2 \quad \dots (\text{ii})$$

$$\text{From question, } \frac{\Delta_1}{\Delta_2} = \frac{3}{5} \text{ or } \frac{\sqrt{a^2 - 4d^2}}{a} = \frac{3}{5}$$

$$\text{or } 25a^2 - 100d^2 = 9a^2 \text{ or } 16a^2 = 100d^2$$

$$\Rightarrow \frac{a}{d} = \frac{5}{2}$$

Ratio of the sides = $a - d : a + d$

$$\begin{aligned} &= \frac{a}{d} - 1 : \frac{a}{d} + 1 = \frac{5}{2} - 1 : \frac{5}{2} + 1 \\ &= \frac{3}{2} : \frac{7}{2} = 3 : 5 : 7 \end{aligned}$$

JEE Main/Boards

Exercise 1

Sol 1: $r = \frac{\Delta}{S}$; $R = \frac{abc}{4\Delta}$

$$\Delta = \sqrt{s(s-a)(s-b)(s-c)} = \sqrt{21(8)(7)(6)} = 84$$

$$R = \frac{abc}{4\Delta} = \frac{(13)(14)(15)}{4 \times 84} = \frac{65}{8}$$

$$r = \frac{84}{21} = 4$$

Sol 2: $r = \frac{\Delta}{S} = \frac{\frac{\sqrt{3}}{4}a^2}{\frac{4}{3a} \times a^2} = \frac{a}{2\sqrt{3}}$

$$R = \frac{abc}{4\Delta} = \frac{a^3}{4 \frac{\sqrt{3}}{4}a^2} = \frac{a}{\sqrt{3}}$$

$$2r = R$$

Sol 3: $\frac{a^2 - b^2}{a^2 + b^2} = \frac{\sin A \cos B - \cos A \sin B}{\sin A \cos B + \cos A \sin B}$

$$\frac{a^2}{b^2} = \frac{\sin A \cos B}{\cos A \sin B} = \frac{\sin A}{\sin B} \cdot \frac{\cos B}{\cos A}$$

$$\Rightarrow \frac{a}{b} = \frac{\cos B}{\cos A} \Rightarrow a \cos A = b \cos B$$

\Rightarrow either $\cos A = 0$ or $\cos B = 0$ or $a = b$

Sol 4: ΔABC

$$\cos A + \cos B = 4 \sin^2 \frac{C}{2}$$

$$2 \cos \frac{A+B}{2} \cos \frac{A-B}{2} = 4 \sin^2 \frac{C}{2}$$

$$2 \sin \frac{C}{2} \cos \frac{A-B}{2} = 4 \sin^2 \frac{C}{2}$$

$$\cos \frac{A-B}{2} = 2 \sin \frac{C}{2} \Rightarrow \frac{\cos \frac{A-B}{2}}{\sin \frac{C}{2}} = 2$$

$$\Rightarrow \frac{2 \cos \frac{C}{2} \cos \frac{A-B}{2}}{2 \cos \frac{C}{2} \sin \frac{C}{2}} = \frac{2 \sin \frac{A+B}{2} \cos \frac{A-B}{2}}{\sin C} = 2$$

$$\Rightarrow \frac{\sin A + \sin B}{\sin C} = 2 \Rightarrow \frac{a+b}{c} = 2$$

Sol 5: $\cos A = \frac{b^2 + c^2 - a^2}{2bc}$

Using cosine formula, we get

Sol 6: $a = 5, b = 7, \sin A = \frac{4}{3}$

$$\frac{a}{\sin A} = \frac{b}{\sin B}$$

$$\sin B = \frac{28}{15} > 1$$

no triangle can be formed.

Sol 7: $\frac{a}{\sin A} = \frac{b}{\sin B}$

$$\frac{\sqrt{6}}{\sin 30^\circ} = \frac{4}{\sin B}$$

$$\sin B = \frac{2}{\sqrt{6}} = \sqrt{\frac{2}{3}}$$

$$\sin B = \sqrt{\frac{2}{3}} \cos B = \pm \frac{1}{\sqrt{3}}$$

$$\sin A = \frac{1}{2} \cos A = \frac{\sqrt{3}}{2}$$

$$\cos C = \frac{a^2 + b^2 - c^2}{2ab} = \cos(180 - (A + B))$$

$$= -\cos A \cos B + \sin A \sin B$$

$$\Rightarrow \frac{22 - c^2}{8\sqrt{6}} = \frac{\sqrt{2} \pm \sqrt{3}}{2\sqrt{3}}; \text{ we get } c = 2\sqrt{3} \pm \sqrt{2}$$

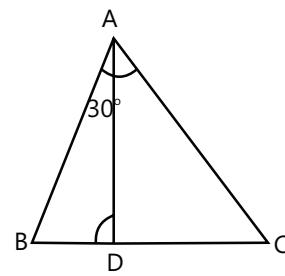

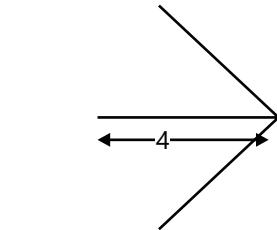

$$\text{Area} = \frac{1}{2} ab \sin C = 2\sqrt{3} - \sqrt{2} \text{ or } 2\sqrt{3} + 2$$

$$\sin 30^\circ = \frac{1}{2}$$

$$\Rightarrow \sin C = \sin(180^\circ - 30^\circ - B) = \sin(150^\circ - B)$$

$$= \sin 150^\circ \cos B - \cos 150^\circ \sin B$$

$$\frac{a^4}{4} = \frac{6b^2 + 2c^2 - a^2}{4}$$

$$a^2 - c^2 = 3b^2$$

$$\cos A \cos C = \frac{(b^2 + c^2 - a^2)(a^2 + b^2 - c^2)}{4b^2ac}$$

Sol 19: $\frac{a \cos A + b \cos B + c \cos C}{\cos A \cos B \cos C}$

from property of a triangle

$$\sin 2A + \sin 2B + \sin 2C = 4 \sin A \sin B \sin C$$

(we can prove this property using basic trigonometric formulas)

$$\angle BOC = 2\left(90 - \frac{A}{2}\right) = 180^\circ - A$$

$$\angle BOE = 90^\circ - \frac{A}{2}$$

$$\angle EBO = 90^\circ - \left(90 - \frac{A}{2}\right) = \frac{A}{2}$$

$$C_3C_2 = 5 + 4 = 9$$

$$C_1C_2 = 3 + 4 = 7$$

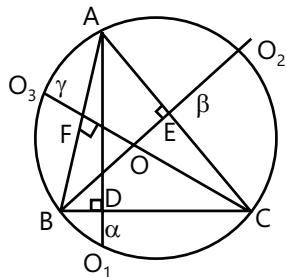

$$OA = OB = OC = k (\text{let's say})$$

since C_3C is angle bisector of angle $\angle C_1C_3C_2$.

So OA is radius of incircle of triangle $\Delta C_1C_2C_3$.

$$\begin{aligned}OA = r &= \frac{\Delta}{S} = \frac{\sqrt{12(12-7)(12-8)(12-9)}}{12} \\ &= \sqrt{5}\end{aligned}$$

$$2 = \frac{1-\cos 2A}{2} + \frac{1-\cos 2B}{2} + \frac{1-\cos 2C}{2}$$

$$4 = 3 - \cos 2A - \cos 2B - \cos 2C$$

$$\cos 2A + \cos 2B + \cos 2C = 1$$

$$2\cos(A+B)\cos(A-B) + 2\cos^2 C - 1 = 1$$

$$2\cos C[\cos C - \cos(A-B)] = 0$$

$$\cos C [\cos(A+B) + \cos(A-B)] = 0$$

$$\text{Since, } P + Q + R = 180^\circ$$

$$\cos B = \frac{c^2 + a^2 - b^2}{2ac}$$

Sol 15: Given that,

$$a = 1 + \sqrt{3}, b = 2 \text{ and } \angle C = 60^\circ$$

We have, $c^2 = a^2 + b^2 - 2ab \cos C$

$$\Rightarrow c^2 = (1 + \sqrt{3})^2 + 4 - 2(1 + \sqrt{3}) \cdot 2 \cos 60^\circ$$

$$\Rightarrow c^2 = 1 + 2\sqrt{3} + 3 + 4 - 2 - 2\sqrt{3}$$

$$\Rightarrow c^2 = 6 \Rightarrow c = \sqrt{6}$$

Using sine rule,

$$\frac{a}{\sin A} = \frac{b}{\sin B} = \frac{c}{\sin C}$$

$$\Rightarrow \frac{1 + \sqrt{3}}{\sin A} = \frac{2}{\sin B} = \frac{\sqrt{6}}{\sin 60^\circ}$$

$$\therefore \sin B = \frac{2 \sin 60^\circ}{\sqrt{6}} = \frac{2 \times \frac{\sqrt{3}}{2}}{\sqrt{6}} = \frac{1}{\sqrt{2}}$$

$$\therefore \angle B = 45^\circ$$

Sol 17: Let ABC be the triangle such that the lengths of its sides CA, AB and BC are $x-1, x$ and $x+1$ respectively where $x \in \mathbb{N}$ and $x > 1$. Let $\angle B = \alpha$ be the smallest angle and $\angle A = 2\alpha$ be the largest angle.

Then, by sine rule, we have

$$\frac{\sin \alpha}{x-1} = \frac{\sin 2\alpha}{x+1}$$

$$\Rightarrow \frac{\sin 2\alpha}{\sin \alpha} = \frac{x+1}{x-1} \Rightarrow 2 \cos \alpha = \frac{x+1}{x-1}$$

$$\therefore \cos \alpha = \frac{x+1}{2(x-1)} \quad \dots (i)$$

$$\text{Also, } \cos \alpha = \frac{x^2 + (x+1)^2 - (x-1)^2}{2x(x+1)}, \text{ using cosine law}$$

$$\Rightarrow \cos \alpha = \frac{x+4}{2(x-1)}$$

From Eqs. (i) and (ii), we get

$$\frac{x+1}{2(x-1)} = \frac{x+4}{2(x+1)}$$

$$\Rightarrow (x+1)^2 = (x+4)(x-1)$$

$$\Rightarrow x^2 + 2x + 1 = x^2 + 3x - 4 \Rightarrow x = 5$$

Hence, the lengths of the sides of the triangle are 4, 5 and 6 unit.

Sol 18: If the triangle is equilateral, then

$$A = B = C = 60^\circ$$

$$\Rightarrow \tan A + \tan B + \tan C = 3\tan 60^\circ = 3\sqrt{3}$$

Conversely assume that

$$\tan A + \tan B + \tan C = 3\sqrt{3}$$

But in triangle ABC, $A + B = 180^\circ - C$

Taking tan on both sides, we get

$$\tan(A+B) = \tan(180^\circ - C)$$

$$\Rightarrow \frac{\tan A + \tan B}{1 - \tan A \tan B} = -\tan C$$

$$\Rightarrow \tan A + \tan B = -\tan C + \tan A \tan B \tan C$$

$$\Rightarrow \tan A + \tan B + \tan C + \tan A \tan B \tan C = 3\sqrt{3}$$

\Rightarrow none of the $\tan A, \tan B, \tan C$ can be negative

$\Rightarrow \Delta ABC$ cannot be obtuse angle triangle

Also, $AM \geq GM$

$$\frac{1}{3} [\tan A + \tan B + \tan C] \geq [\tan A \tan B \tan C]^{1/3}$$

$$\Rightarrow \frac{1}{3} (3\sqrt{3}) \geq (3\sqrt{3})^{1/3} \Rightarrow \sqrt{3} \geq \sqrt{3}$$

So, the equality can hold if and only if

$\tan A = \tan B = \tan C$ or $A = B = C$ or when the triangle is equilateral.

$$\frac{I_n}{O_n} = \frac{1 + \sqrt{1 - (2I_n/n)^2}}{2} \quad [\text{from Eq. (i)}]$$

$$I_n = \frac{O_n}{2} \left(1 + \sqrt{1 - (2I_n/n)^2} \right)$$

In $\triangle ABC$ by Cosine Law, we get

$$\cos \theta = (n+1)^2 + (n+2)^2 - n^2/(2(n+1)(n+2)) \quad \dots (ii)$$

Comparing the values of $\cos \theta$ from (i) and (ii), we get

$$(n+1)^2 + (n+2)^2 - n^2/(2(n+1)(n+2)) = n+2/2n$$

$$\Rightarrow (n+2)^2(n+1) = n(n+2)^2 + n(n+1)^2 - n^2$$

$$\Rightarrow n(n+2)^2(n+2)^2 = n(n+2)^2 + n(n+1)^2 - n^3$$

$$\Rightarrow n^2 + 4n + 4 = n^3 + 2n^2 + n - n^3$$

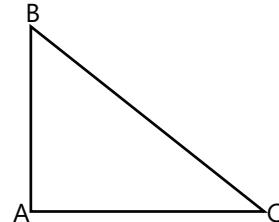

$$\Rightarrow n^2 - 3n - 4 = 0 \Rightarrow (n+1)(n-4) = 0$$

$$\Rightarrow n = 4 \text{ (as } n \neq -1)$$

\therefore Sides of \triangle are $4, 4+1, 4+2$, i.e. $4, 5, 6$.

Sol 1: (D) Here, for

(a) If $a, \sin A, \sin B$ are given, then we can determine $b = \frac{a}{\sin A} \sin B, c = \frac{a}{\sin A} \sin C$. So, all the three sides are unique.

So, option (A) is incorrect.

(b) The three sides can uniquely make an acute angled triangle. So, option (B) is incorrect.

(c) If $a, \sin B, R$ are given, then we can determine $b = 2R \sin B, \sin A = \frac{a \sin B}{b}$. So, $\sin C$ can be determined.

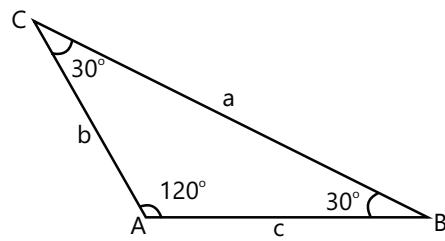

Hence, side c can also be uniquely determined.

(d) If $a, \sin A, R$ are given, then

$$\frac{b}{\sin B} = \frac{c}{\sin C} = 2R$$

But this could not determine the exact values of b and c .

$$\Rightarrow 4x + x + x = 180^\circ$$

$$\Rightarrow x = 30^\circ$$

$$\therefore \angle A = 120^\circ, \angle B = \angle C = 30^\circ$$

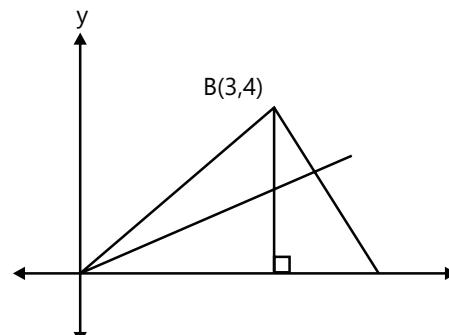

Thus, the ratio of longest side to perimeter $= \frac{a}{a+b+c}$

Let $b = c = x$

$$\Rightarrow a^2 = b^2 + c^2 - 2bc \cos A$$

$$\Rightarrow a^2 = 2x^2 - 2x^2 \cos 120^\circ = 2x^2(1 - \cos 120^\circ)$$

$$\Rightarrow a^2 = 4x^2 \sin^2 60^\circ \Rightarrow a = 2x \sin 60^\circ$$

$$\Rightarrow a = 2x \sin 60^\circ = \sqrt{3}x$$

Thus, required ratio is

$$\frac{a}{a+b+c} = \frac{\sqrt{3}x}{x+x+\sqrt{3}x} = \frac{\sqrt{3}}{2+\sqrt{3}}$$

Sol 22 : It is given that a, b, c and area of Δ are rational.

$$\text{We have, } \tan\frac{B}{2} = \sqrt{\frac{(s-c)(s-a)}{s(s-b)}}$$

$$= \frac{\sqrt{s(s-a)(s-b)(s-c)}}{s(s-b)} = \frac{\Delta}{s(s-b)}$$

Again, a, b, c are rational given, $s = \frac{a+b+c}{2}$ are rational,

Also, $(s-b)$ is rational since, Δ is rational, therefore, we get

$$\tan\left(\frac{B}{2}\right) = \frac{\Delta}{s(s-b)} \text{ is rational.}$$

$$\text{Similarly, } \tan\left(\frac{C}{2}\right) = \frac{\Delta}{s(s-c)} \text{ is rational,}$$

Therefore $a, \tan\frac{B}{2}, \tan\frac{C}{2}$ are rational.

Which shows that (i) \Rightarrow (ii)

Again, it is given that

$a, \tan\frac{B}{2}, \tan\frac{C}{2}$ are rational, then

$$\tan\frac{A}{2} = \tan\left(\frac{\pi}{2} - \frac{B+C}{2}\right)$$

$$\Rightarrow \cot\left(\frac{B+C}{2}\right) = \frac{1}{\tan\left(\frac{B+C}{2}\right)} = \frac{1 - \tan\left(\frac{B}{2}\right) \cdot \tan\left(\frac{C}{2}\right)}{\tan\left(\frac{B}{2}\right) + \tan\left(\frac{C}{2}\right)}$$

Since, $\tan(B/2)$ and $\tan(C/2)$ are rational numbers, we get $\tan(A/2)$ is a rational number.

Now, $\sin A = \frac{2 \tan A/2}{1 + \tan^2 A/2}$ as $\tan(A/2)$ is a rational

number, $\sin A$ is a rational number. Similarly, $\sin B$ and $\sin C$ are rational numbers. Thus, a, $\sin A$, $\sin B$, $\sin C$ are rational numbers therefore (ii) \Rightarrow (iii)

Now again, a, $\sin A$, $\sin B$, $\sin C$ are rational.

By the sine rule $\frac{a}{\sin A} = \frac{b}{\sin B} = \frac{c}{\sin C}$

$$\Rightarrow b = \frac{a \sin B}{\sin A} \text{ and } c = \frac{a \sin C}{\sin A}$$

since a, $\sin A$, $\sin B$ and $\sin C$ are rational numbers,

$\Rightarrow b$ and c are also rational.

$$\text{Also, } \Delta = \frac{1}{2}bc \sin A$$

As b , c and $\sin A$ are rational numbers, Δ is a rational number.

Therefore, a , b , c and Δ are rational numbers.

Therefore (iii) \Rightarrow (i).

Sol 23: Since, $A + B + C = \pi$

$$\therefore 0 < B, C < 3\pi/4.$$

Also, given $\tan B \cdot \tan C = p$

$$\Rightarrow \frac{\sin B \cdot \sin C}{\cos B \cdot \cos C} = \frac{p}{1} \quad \dots(\text{i})$$

$$\Rightarrow \frac{\sin B \cdot \sin C + \cos B \cos C}{\sin B \cdot \sin C - \cos B \cos C} = \frac{p+1}{p-1}$$

$$\Rightarrow \frac{\cos(B-C)}{\cos(B+C)} = \frac{1+p}{1-p}$$

$$\Rightarrow \cos(B-C) = -\frac{(1+p)}{\sqrt{2}(1-p)} \quad \dots(\text{ii}) \quad (B+C = 3\pi/4)$$

Since, B or C can vary from 0 to $3\pi/4$

$$0 \leq B-C < 3\pi/4$$

$$-\frac{1}{\sqrt{2}} < \cos(B-C) \leq 1$$

Now, in right angled triangle IHJ ,

$$\angle JIH = \pi/2 - A/2$$

[$\angle IEA = 90^\circ$, $\angle IAE = A/2$ and $\angle JIH = \angle AIE$] in triangle JIH

$$\tan\left(\frac{\pi}{2} - \frac{A}{2}\right) = \frac{r_1}{r - r_1} \Rightarrow \cot\frac{A}{2} = \frac{r_1}{r - r_1}$$

On adding above results, we get

$$\cot A/2 + \cot B/2 + \cot C/2 = \cot A/2 \cot B/2 \cot C/2$$

$$\Rightarrow \frac{r_1}{r - r_1} + \frac{r_2}{r - r_2} + \frac{r_3}{r - r_3} = \frac{r_1 r_2 r_3}{(r - r_1)(r - r_2)(r - r_3)}$$
